At our specialized, state-of-the-art practice, we pinpoint your child's seizures and what may be triggering them and work with you to tailor a plan of care that meets her or his needs. Our goal is to provide an immediate assessment, thorough evaluation, accurate diagnosis and treatment plan. Through our multidisciplinary team, you will meet specialists dedicated to improving your child’s quality of life and navigating the challenges that are associated with a diagnosis of seizures and/or living with epilepsy.

We are affiliated with New York City's top-ranked Phyllis and David Komansky Children's Hospital at NewYork-Presbyterian/Weill Cornell Medical Center.
Services & Programs
We offer multiple subspecialty clinics/programs that offer expertise in all areas of epilepsy, particularly in treating early onset epilepsy and refractory epilepsy:

- New onset seizure clinic
- Infantile spasms clinic
- Lennox Gastaut clinic
- Ketogenic Diet Program
- Genetics Epilepsy Clinics
- Tuberous Sclerosis Complex
- Dravet Syndrome/PCDH19
- Multidisciplinary Joint Neurosurgery-Epilepsy Clinic

Our medical team partners as needed with Weill Cornell Medicine’s Pediatric Neurosurgery team. For more information about our pediatric

Diagnosis & Treatment
When you come to us for epilepsy care, we offer you and your family:

A multidisciplinary approach: Your child has access to a team of pediatric specialists including pediatric epileptologists, pediatric neurologists, pediatric neurosurgeons, neuroradiologists, electroencephalogram (EEG) technologists, nurse practitioners, psychologists, psychiatrists, and dietitians. Moreover, if your child needs health care for another medical condition, we have the specialists and subspecialists onsite to meet those needs as well.

Dedicated Pediatric Epilepsy Monitoring: One of the most important components of your child's epilepsy care is the diagnosis. We use the most advanced EEG technology to pinpoint the location, type, and severity of your child's seizures. In addition to neurological imaging studies, we use sophisticated tools to assess your child's brain function, including EEG monitoring and special electrophysiologic mapping techniques. We use the findings of these tests to plan surgery in children with epilepsy that cannot be adequately controlled with other therapies.

Customized Therapy: We tailor therapy to your child's needs, taking into account other factors — such as lifestyle, stress, sleep habits, and diet — that may serve as triggers for seizures. Available treatments include antiseizure medications, dietary therapy and vitamins, and surgery for those children whose seizures cannot be controlled with nonsurgical methods.

Specialized Care for Children with Other Disorders: Some disorders may predispose children to seizures, such as tuberous sclerosis complex, neurofibromatosis, and autism spectrum disorders. If your child has one of these disorders or another genetic disorder that can cause seizures, our dedicated specialists with expertise in these areas are available.
Transitional Care to Adulthood: We recognize that epilepsy is a lifelong condition and that children's needs change as they get older, particularly during their teenage years. We work with teens to help them understand their responsibility for their health and to hear what they have to say about their personal goals. We use this information to tailor their therapy as they get older to meet their current needs at each stage of life. As they get ready to leave their teen years, we work with them and with our adult epilepsy treatment specialists to facilitate the gradual transition from pediatric to adult care, ensuring continuity of treatment.

Care for Your Family: The needs of a child with epilepsy affect the entire family. We work closely with your family to address your child's needs and to assess how those needs influence your family's dynamic. For school-age children who require longer-term care, we have staff available to help children keep up with their educational development.

Our Team
Our team includes specialists from pediatric neurology, pediatric neurosurgery, nutrition, and other disciplines.

Dr. Zachary Grinspan
Director, Pediatric Epilepsy Program
Associate Professor of Pediatrics
Associate Attending Pediatrician
Nanette Laitman Clinical Scholar in Healthcare Policy & Research/Community Health
Associate Professor of Healthcare Policy & Research

Research

Dr. Zach Grinspan directs a pediatric epilepsy research program that focuses on how analysis of large clinical and administrative datasets can answer core questions for children with epilepsy. His current projects and areas of interest include:

- **Rare Epilepsies in New York City (RENYC).** Rare epilepsies are a devastating group of diseases that begin in childhood, and are often associated with profound neurologic, medical, and psychiatric disabilities. We are working to collect electronic physician notes from five academic medical centers in New York City to identify cases in order to understand the essential epidemiology of this vulnerable and medically complex population (incidence, prevalence, mortality, comorbidity burden, and use of health services). Using new methods for surveillance, we will develop and characterize an easy-to-share tool to find rare epilepsies through an automated search of clinical notes.

- **Sudden Unexpected Death in Epilepsy (SUDEP).** We are reviewing physician notes to understand how and when physicians counsel children with epilepsy about SUDEP.

- **Comparative Effectiveness for infantile Spasms.** Infantile Spasms is a devastating epilepsy of infancy that can cause permanent neurodevelopmental disability. There are three recommended treatments: ACTH, oral steroids, and vigabatrin. We are comparing these treatments for infantile spasms using several large datasets.

- **Early Life Epilepsies.** We are comparing the effectiveness of commonly used medications for children aged 0 - 3 with new onset epilepsy.

- **Health Services Research:** We are studying how children with epilepsy use health services (doctor visits, imaging, EEGs, etc.).

What Sets us Apart

- Refractory epilepsy patients are seen by a multidisciplinary team during one office visit that includes an epileptologist, neurosurgeon, ketogenic dietician, social worker, and a neuropsychologist.
- Our doctors are affiliated with NewYork-Presbyterian Hospital, included on the 2017-2018
